

Metal Industry Indicators

Indicators of Domestic Primary Metals, Steel, Aluminum, and Copper Activity

September 2003

The primary metals leading index advanced in August to its highest point in the current recovery. Three of the other four metal industry leading increased in July, the latest month for which they are available. However, the leading index of metal prices moved lower in July.

Based on preliminary data, the **primary metals leading index** surged 2.7% in August, climbing to 134.1 from a revised 130.6 in July. The index's 6-month smoothed growth rate moved up to 8.7% from a revised 3.8% in July. The 6-month smoothed growth rate is a compound annual rate that measures the near-term trend. Normally, a growth rate above +1.0% signals an upward trend for future growth in metals activity, while a growth rate below -1.0% indicates a downward trend.

Four of the leading index's eight components were available in time to compute the August index value. The stock price component, which posted its largest gain in over 4 years in August, made the largest positive contribution to the increase in the leading index. The Institute for Supply Management's PMI, an index of manufacturing activity, registered a strong gain. The JOC-ECRI metals price index growth rate also moved higher. However, the length of the average workweek in primary metals establishments was unchanged from a 12-year low in July.

Even if the size of the August increase in the primary metals leading index is smaller after the remaining four components are added, the growth rate of the leading index will still be above the threshold that indicates increasing growth in U.S. primary metals industry activity.

The **steel leading index** edged up 0.1% in July to 110.9 from a downwardly revised 110.8 in June. The index's 6-month smoothed growth rate moved up to 1.4% from a revised 1.1% in June. Although six of the leading index's nine components increased in July, another sharp decline in the length of the average workweek in iron and steel mills held back the increase in the leading index. Over the past 2 months the length of the workweek has contracted by 2.3 hours, the largest 2-month drop since 1971. The biggest positive contribution to the net increase in the leading index came from retail sales of U.S. passenger cars and light trucks. Except for the weakness in the average workweek component, the steel leading index has been fairly strong in recent months, suggesting the possibility of an increase in domestic steel industry activity in the near term.

The **aluminum mill products leading index** advanced 1.1% in July to 166.3 from a downwardly revised 164.5 in June, and its 6-month smoothed growth rate increased to 1.5% from a revised -0.6% in June. The June index was revised lower with the addition of the average workweek component, which decreased sharply in June. The average workweek component was not available for July. All but one of the available components increased in July. The largest positive contributors were retail sales of U.S. passenger cars and light trucks and the PMI. The growth rate of the aluminum mill products leading index suggests that growth in U.S. aluminum mill products industry activity could pick up in the coming months.

The **primary aluminum leading index** dipped 0.6% in July, down to 80.4 from a revised 80.9 in June. The index's 6-month smoothed growth rate slowed to 4.8% from a revised 7.2% in June. Five of the index's six components were available for the July index calculation. The largest negative contribution came from the index measuring the trade-weighted average exchange value of other major currencies against the U.S. dollar. The price of primary aluminum on the London Metal Exchange registered the only increase. Despite the July decrease, the growth rate of the primary aluminum leading index continues to signal increased growth in domestic primary aluminum industry activity in the near term.

The **copper leading index** climbed 1.5% in July to 119.4 from a revised 117.6 in June. That marks the largest 1-month gain in this index since April 1999. Furthermore, the index's 6-month smoothed growth rate advanced sharply, rising to 4.0% from a revised 0.8% in June. Three of the leading index's six components advanced in July, and three moved lower. However, the increases were quite strong while the declines were relatively modest. The largest increase in the yield spread since 1984 made the biggest contribution to the net increase in the leading index. Average weekly overtime hours in copper rolling, drawing, extruding, and alloying establishments and the spot price of copper on the London Metal Exchange also registered strong gains. The growth rate of the copper leading index has begun to

signal an increase in U.S. copper industry activity in the months ahead.

Metals Price Leading Index Moves Lower in July

The **metals price leading index** decreased 0.4% in July, the latest month for which it is available, down to 112.0. However, that decrease was from an upwardly revised June value of 112.5, an 11-month high. The index's 6-month smoothed growth rate slowed to 1.7% from a revised 2.5% in June. The growth rate has been above +1.0% the past 3 months.

Three of the leading index's four components were available in time to compute the July index value. Two of the available components, the growth rates of the index measuring the trade-weighted average exchange value of other major currencies against the U.S. dollar and the inflation-adjusted value of new orders for U.S. nonferrous metal products, moved lower. In contrast, the yield spread between the U.S. 10-year Treasury Note and the federal funds rate widened.

The fourth index component, the growth rate of the Economic Cycle Research Institute's (ECRI) 18-Country Long Leading Index, was available only through June, when it increased. Adding the June value of the ECRI index was the main reason that the metals price leading index was revised higher in June.

The growth rate of the inflation-adjusted value of inventories of U.S. nonferrous metal products, which generally moves inversely with metal prices, moved up to -0.4% in July from -1.4% in June. This indicator has been revised reflecting revisions to current-dollar inventories, as well as changes to the methodology used to combine the inventories.

The growth rate of the metals price leading index is pointing to increases in overall metal prices in the coming months. The business cycle, and inventories are only two factors in metals price determination. Other factors that affect prices include changes in metals production, speculation, strategic stockpiling, foreign exchange rates, geopolitical instability, and production costs.

Table 1.
Leading Index of Metal Prices and Growth Rates of the Nonferrous Metals Price Index, Inventories of Nonferrous Metal Products, and Selected Metal Prices

	Leading Index of Metal Prices (1967=100)	Six-Month Smoothed Growth Rates

NA: Not available r: Revised

Note: The components of the Leading Index of Metal Prices are the spread between the U.S. 10-year Treasury Note and the federal funds rate, and the 6-month smoothed growth rates of the deflated value of new orders for nonferrous metal products, the Economic Cycle Research Institute's 18-Country Long Leading Index, and the reciprocal of the trade-weighted average exchange value of the U.S. dollar against other major currencies. The Metal Industry Indicators (MII) Nonferrous Metals Price Index measures changes in end-of-the-month prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange (LME). The steel scrap price used is the price of No. 1 heavy melting. Inventories consist of the deflated value of finished goods, work in progress, and raw materials for U.S.-produced nonferrous metal products (NAICS 3313, 3314, & 335929). Six-month smoothed growth rates are based on the ratio of the current month's index or price to its average over the preceding 12 months, expressed at a compound annual rate.

Coincident: 1, Federal Reserve Board; 2, Bureau of Labor Statistics and U.S. Geological Survey; 3, U.S. Census Bureau and U.S. Geological Survey. All series are seasonally adjusted, except 2, 3, and 4 of the leading index.

NA: Not available **r:** Revised

Note: A component's contribution, shown in Tables 3, 5, 7, and 9, measures its effect, in percentage points, on the percent change in the index. Each month, the sum of the contributions plus the trend adjustment equals (except for rounding differences) the index's percent change from the previous month.

CHART 10.

PRIMARY ALUMINUM LEADING AND COINCIDENT INDEXES, 1981-2003 1977=100

CHART 11.

PRIMARY ALUMINUM LEADING AND COINCIDENT GROWTH RATES, 1981-2003

The growth rates are expressed as compound annual rates based on the ratio of the current month's index to its average level during the preceding 12 months.

Explanation

Each month, the U.S. Geological Survey tracks the effects of the business cycle on five U.S. metal industries by calculating and publishing composite indexes of leading and coincident indicators. Wesley Mitchell and Arthur Burns originated the cyclical-indicators approach for the economy as a whole at the National Bureau of Economic Research in the mid-1930s. Over subsequent decades this approach was developed and refined, mostly at the National Bureau, under the leadership of Geoffrey H. Moore.¹

A business cycle can briefly be described as growth in the level of economic activity followed by a decline succeeded by further growth. These alternating periods of growth and decline do not occur at regular intervals. Composite indexes, however, can help determine when highs and lows in the cycle might occur. A composite index combines cyclical indicators of diverse economic activity into one index, giving decision makers and economists a single measure of how changes in the business cycle are affecting economic activity.

The indicators in the metal industry leading indexes historically give signals several months in advance of major changes in a coincident index, a measure of current metal industry activity. Indicators that make up the leading indexes are, for the most part, measures of anticipations or new commitments to various economic activities that can affect the metal industries in the months ahead.

Composite coincident indexes for the metal industries consist of indicators for production, shipments, and total employee hours worked. As such, the coincident indexes can be regarded as measures of the economic health of the metal industries.

The metal industry coincident indexes reflect industry activity classified by the U.S. Standard Industrial Classification (SIC) and the North American Industry Classification System (NAICS). Of the five metal industries, primary metals (NAICS 331) is the broadest, containing 25 different metal processing industries. Steel, aluminum, and copper are specific industries within the primary metals group.

The SIC was the main vehicle used by the U.S. Government and others in reporting industry economic statistics throughout most of the last century. Starting with the 1997 U.S. Economic Census, the U.S. Government began using the NAICS, which classifies economic data for industries in Canada, Mexico, and the United States. In general, metal industry indexes starting in 1997 begin to reflect the NAICS classification, while indexes for earlier years follow the SIC. Hence, composite indexes from 1997 forward are not entirely consistent with those of earlier years.

The largest change to primary metals because of the NAICS deals with other communication and energy wire manufacturing (NAICS 335929). Under NAICS, this manufacturing has been removed from primary metals and added to electrical equipment, appliance, and component manufacturing. Because monthly shipments and new orders for this wire are not available, the USGS is estimating their values from 1997 onward and adding them to the appropriate metal industry indicators and indexes to maintain consistency.

¹**Business Cycle Indicators, A monthly report from The Conference Board** (March 1996).

There are other small changes to the primary metals industry because of the switch to the NAICS. Coke oven activity not done by steel mills, for example, is removed and alumina refining, a part of industrial inorganic chemical manufacturing under the SIC, is added. Since the historic trends of the composite indexes are not affected by these small changes, the USGS is not making specific adjustments to the indexes for them for the periods before and after 1997.

The metal industry leading indexes turn before their respective coincident indexes an average of 8 months for primary metals and 7 months for steel and copper. The average lead time for the primary aluminum leading index is 6 to 8 months, and the average lead time for the aluminum mill products leading index is 6 months.

The leading index of metal prices, also published in the *Metal Industry Indicators*, is designed to signal changes in a composite index of prices for primary aluminum, copper, lead, and zinc traded on the London Metal Exchange. On average, this leading index indicates significant changes in price growth about 8 months in advance.

The growth rate used in the *Metal Industry Indicators* is a 6-month smoothed growth rate at a compound annual rate, calculated from a moving average. Moving averages smooth fluctuations in data over time so that trends can be observed. The 6-month smoothed growth rate is based upon the ratio of the latest monthly value to the preceding 12-month moving average.

$$\left[\left(\frac{\text{current value}}{\text{preceding 12-month moving average}} \right)^{\frac{12}{6.5}} - 1.0 \right] * 100$$

Because the interval between midpoints of the current month and the preceding 12 months is 6.5 months, the ratio is raised to the 12/6.5 power to derive a compound annual rate.

The growth rates measure the near-term industry trends. They, along with other information about the metal industries and the world economy, are the main tools used to determine the outlook of the industries. A 6-month smoothed growth rate above +1.0% usually means increasing growth; a rate below -1.0% usually means declining growth.

The next summary is scheduled for release on the World Wide Web at 10:00 a.m. EDT, Friday, October 17. The address for *Metal Industry Indicators* on the World Wide Web is:
<http://minerals.usgs.gov/minerals/pubs/mii/>

The *Metal Industry Indicators* is produced at the U.S. Geological Survey by the Minerals Information Team. The report is prepared by Kenneth Beckman (703-648-4916; e-mail: kbeckman@usgs.gov), and Gail James (703-648-4915; e-mail: gjames@usgs.gov). The former Center for International Business Cycle Research, under the direction of Dr. Geoffrey H. Moore, and the former U.S. Bureau of Mines developed the metal industry leading and coincident indexes in the early 1990s. Customers can send mail concerning the *Metal Industry Indicators* to the following address:
